

meetwise reporter

reporter

meetwise reporter

meetwise reporter

The meetwise reporter allows user to share their desktop in realtime with remote participants and to work together on it.

The meetwise reporter is connected to the presentation laptop and the beamer. After the VGA cable is connected the signal is automatically transmitted.

Remote users connect to the meetwise reporter via intra- oder internet simply by using a standard webbrowser. Also on the client side no further software is needed.

Advantages

meetwise reporter has some unbeatable advantages:

- **No hassle** in the meeting room, no training, no questions, no helpless search for a technician
- **no running costs:** in contrast to web collaboration solutions there are no costs for using the system
- **no software:** There is no software needed on the presentation side. The Client only needs a browser to connect to the system
- **no installation hurdles:** the meetwise reporter works with any PC, any notebook, any operating system and any resolution and of course with every projector.
- **no security holes:** all communications are encrypted via AES hardware. No holes in your firewall - the information is transported via standard http/https ports 80 and 443.

How it works

The projector is connected to the meetwise reporter, the presentator's notebook is not connected directly to the projector, but to the meetwise reporter. The video signal of the presentator's notebook is looped through to the projector.

The reporter itself is connected to the local network. Remote participants connect to the meetwise reporter embedded webserver via intra- or internet connections, and can see the live screen content and are able to interact with it.

How does the presenter use the meetwise reporter?

- connect your notebook to the reporter (VGA cable),
- activate the VGA output (eg. FN+F7) of your notebook
- You're done!

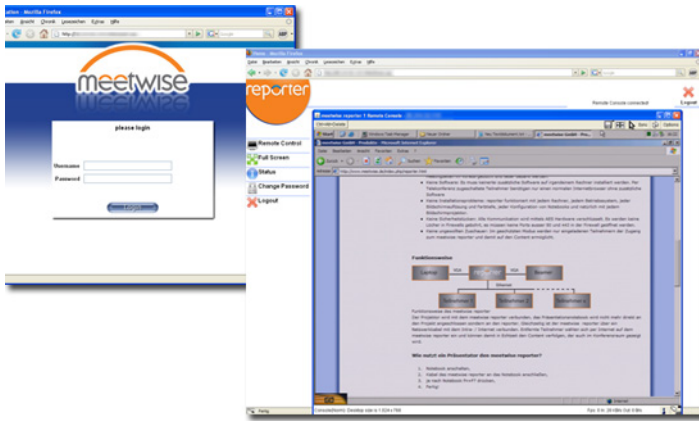

All participants in the meeting room and the remote clients can now view your screen. No questions, no emailing of slides and sheets - simply more effective meetings.

How does the remote user work with the meetwise reporter?

The participants receive an URL, which leads to the login page of the meetwise reporter. This URL can be sent via email manually or sent through the Outlook/Exchange invitation system and of course simply told to the user via telephone.

The login accepts different login modes, depending on the security mode, setup and needs of the company and user. After the successful login the user sees the content shown in the conference room in real time.

If the presentator has connected the optional USB cable between the reporter and his notebook, the remote participants are able to work together on the presentator computer, using the remote control function (mouse and keyboard input) of the presentator's notebook like their own.
